General comments: Although, the term used when refering to KPIs ca widely vary, it is important to ensure that a common language is used within the entity. The usage of ”Key Performance Indicators” is one of the most popular terms used in practice and it can be clearly differentiated as a concept from a simple performance measure or indicator.

The KPI Institute’s perspective: To keep things simple in terms of terminology, The KPI Institute recomends the usage of 3 key concepts:

- **Metrics** - referring to something that can be measured, a value or a quantity. They can be used to monitor different processes, without desired targets to be reached.
- **Key Performance Indicators** – metrics that make objectives quantifiable, providing visibility into the performance of individuals, teams, departments and organizations and enabling decision makers to take action in achieving the desired outcomes.
- **Key Risk Indicators** - metrics that provides an early warning regarding an increased risk exposure in a certain area of operations.
